### What is Cosmos DB

Ch-ch-changes: Tracing Changes in Azure Cosmos DB

# A globally distributed, massively scalable, multi-model database service

A globally distributed, massively scalable, multi-model database service

### Turnkey global distribution

A globally distributed, massively scalable, multi-model database service

### Turnkey global distribution

A globally distributed, massively scalable, multi-model database service

### Elastic scale out of storage & throughput

A globally distributed, massively scalable, multi-model database service

### Elastic scale out of storage & throughput

A globally distributed, massively scalable, multi-model database service

### Guaranteed low latency at the 99<sup>th</sup> percentile

A globally distributed, massively scalable, multi-model database service

### Guaranteed low latency at the 99<sup>th</sup> percentile

A globally distributed, massively scalable, multi-model database service

### Five well-defined consistency models

A globally distributed, massively scalable, multi-model database service

### Five well-defined consistency models

A globally distributed, massively scalable, multi-model database service

### Comprehensive SLAs

A globally distributed, massively scalable, multi-model database service

### Comprehensive SLAs

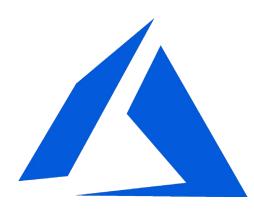

A globally distributed, massively scalable, multi-model database service

#### **Battle Tested**

A globally distributed, massively scalable, multi-model database service

#### **Battle Tested**

A globally distributed, massively scalable, multi-model database service

#### **Ubiquitous Regional Presence**

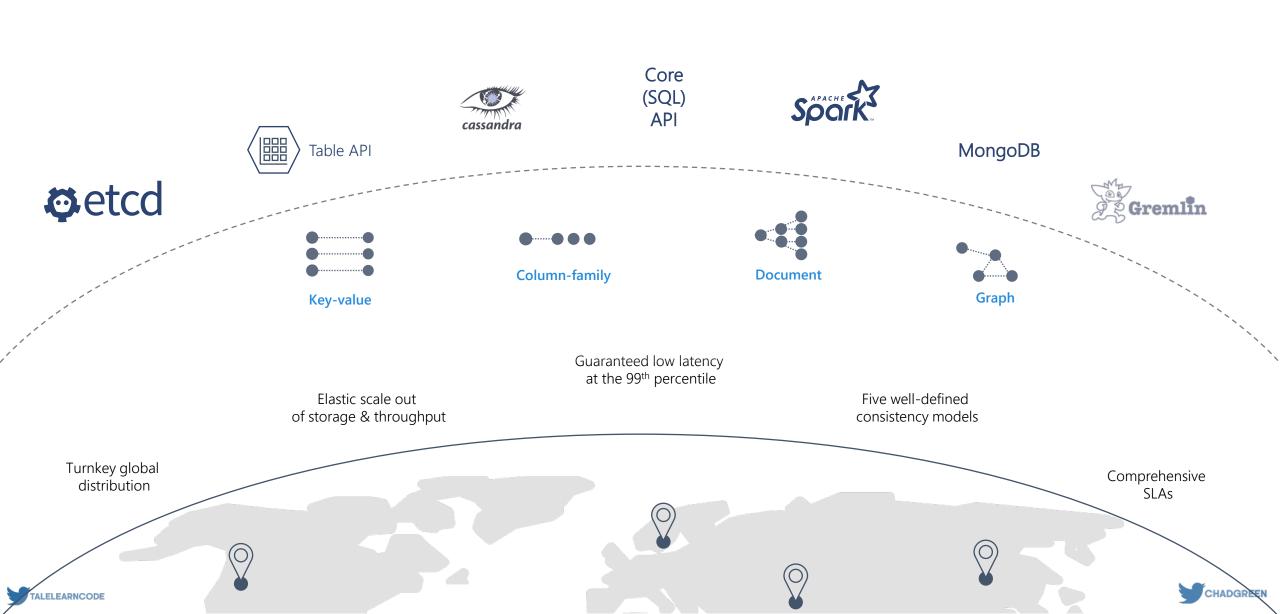

A globally distributed, massively scalable, multi-model database service

### Secure by default and enterprise ready

A globally distributed, massively scalable, multi-model database service

### Demos

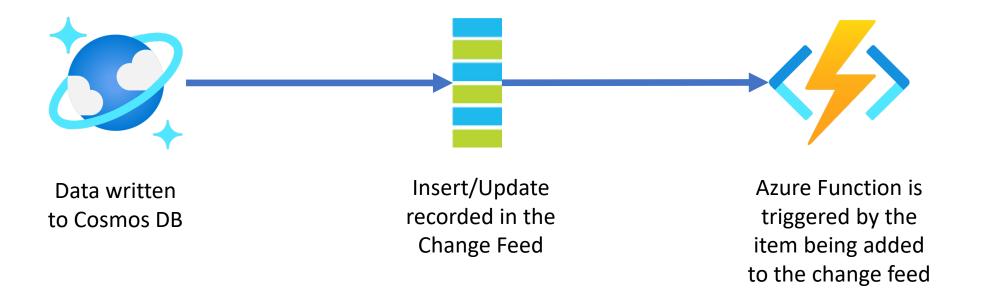

Ch-ch-changes: Tracing Changes in Azure Cosmos DB

### Basic Change Feed Demo

**Change Feed Demos** 

### Scenario

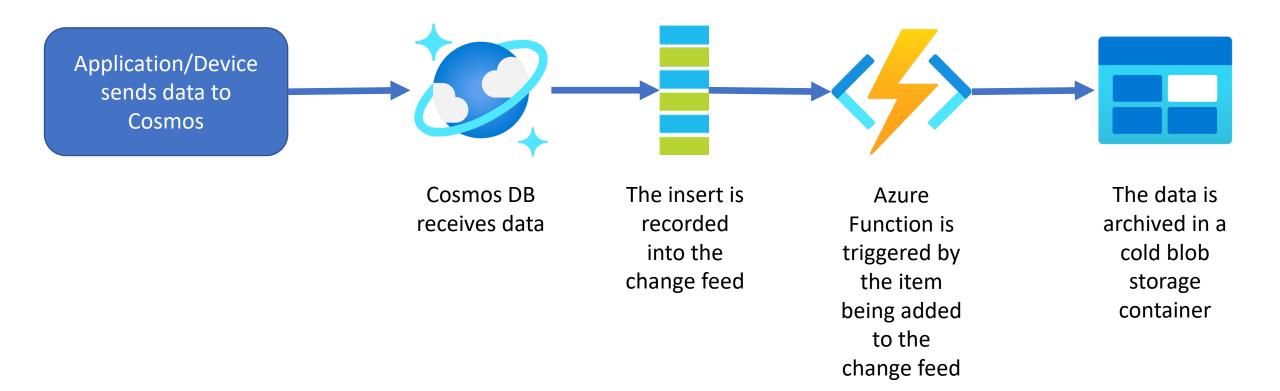

- Practice test application
- Data is useful for active queries within 30 days (2,592,000 seconds)
- Need to keep archive for historical, compliance reasons
- Demo will process 428k records over 24-hour period
- Real data that has been autonomized

### **Data Archival**

**Change Feed Demos** 

### Scenario

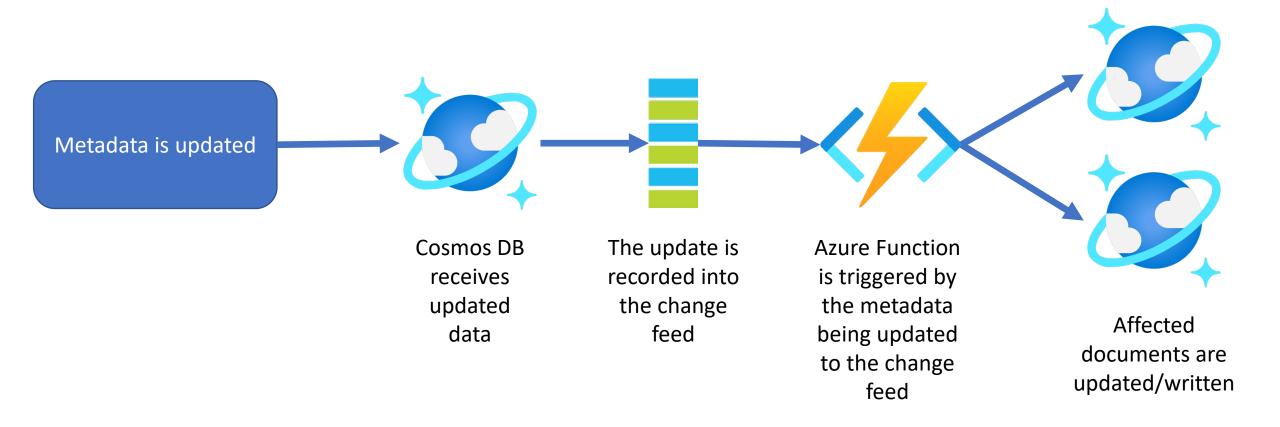

- Shindig Manager
- Manages presentations for different shindigs (events)
- Metadata maintained in its own container
- Need way to update denormalized data in shindig (event) partitions

#### Denormalization

**Change Feed Demos** 

**Change Feed Demos** 

### Scenario

- Shindig Manager
- Manages presentations for different shindigs (events)
- Presentations partitioned by shindig
- Want to improve query performance when searching across tags (original partitioning would require cross-partition querying)

### Replicating Containers

**Change Feed Demos** 

Cosmos DB receives data

The insert/update is recorded into the change feed

Azure Function is triggered by the item being added/update d to the change feed

Document is sent to replicated Cosmos container(s)

### **Triggering Event-Driven Architecture**

### Scenario

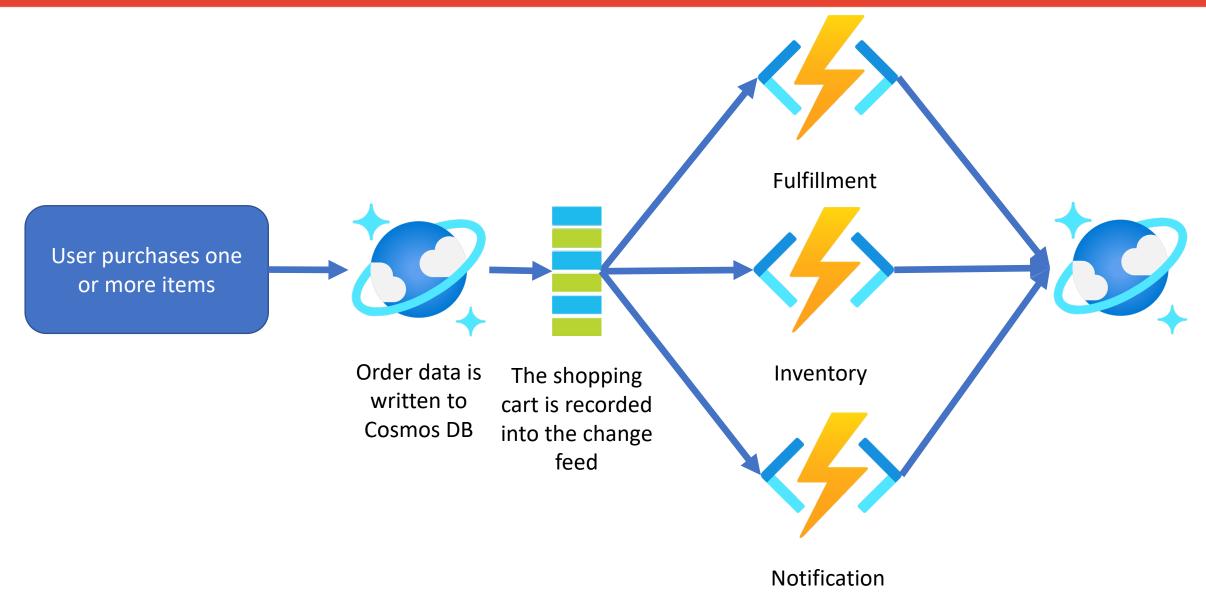

- Shopping cart implementation Lego store
- Implementing an event-driven architecture to allow for asynchronous processing of an order
- Note: functions are only simulating doing actions

### **Triggering Event-Driven Architecture**

**Change Feed Demos**
